

Regulatory Compliance Program Build — Digital Health Technology Company

Context

A Canadian digital health technology company planned to expand into British Columbia. The company held SOC 2 Type II certification but had no compliance program for BC's health-sector regulatory regime, which differs materially from its home province — including consent requirements, data residency, and mandatory conformance certification for connecting to provincial health information systems.

Objective

Design and build the full compliance program: identify every applicable legal and regulatory requirement, determine what documentation and evidence the company already held, produce what was missing, and sequence the regulator submission process.

Scope

- Legislative and regulatory mapping across provincial privacy law, health information legislation, and the province's conformance standards for health information exchange
- Gap assessment against the company's existing SOC 2 control set and evidence
- Policy, procedure, and evidence documentation development
- Regulator form identification and submission sequencing
- Stakeholder input gathering across six internal groups

Out of scope: technical security testing and remediation. Existing test evidence was inventoried and mapped, not re-performed.

Approach

1. **Legislation mapping.** Read the primary legislation, regulator guidance, and conformance standards directly rather than relying on vendor summaries, then decomposed them into discrete, assignable requirements.
2. **Requirements decomposition.** Converted the requirements into a master register of 77 accountable deliverables, each with a named owner, format, and status.
3. **Reuse before rebuild.** Mapped existing SOC 2 policies and evidence against the new requirements to avoid duplicating work — 15 items carried over directly.
4. **Document production.** Drafted 50+ policy, procedure, and evidence documents in submission-ready format, with placeholders flagged where engineering confirmation was pending.
5. **Submission sequencing.** Verified the regulator's full forms set at the source (which surfaced five forms not referenced in vendor-facing documentation) and filed the first two submissions.

FRAMEWORK MAPPING

Frameworks Applied in This Engagement

Regulatory Compliance Program Build — Digital Health Technology Company · Client Practicum

Provincial Private-Sector Privacy Legislation PRIVACY Consent model, collection and disclosure rules, and the differences from the company's home-province regime.	Health Information Exchange Conformance Standards SECTOR CERTIFICATION Security and documentation requirements for certification to connect to provincial health systems.
Regulator Guidance on AI-Enabled Clinical Tools AI GOVERNANCE Applied to the company's AI product features as part of the compliance program.	SOC 2 — Common Criteria CONTROLS REUSE Used as the baseline control set for the gap assessment and evidence reuse.

PROGRAM OUTPUTS

Deliverables

01 Compliance & Conformance Guides Legislation mapped directly to concrete, assignable obligations.	02 Master Deliverable Register 77 items tracked end to end with ownership and status.
03 Policy & Evidence Documents 50+ documents drafted in submission-ready format.	04 Requirements & Evidence Registers Spreadsheet-based tracking across the full program.
05 Stakeholder Questionnaire 85 questions administered across six internal groups.	06 Regulator Forms Completed in full; first two submitted within the engagement.

RESULTS

Outcomes

01 Zero to Structured Compliance program built end to end within the practicum window.	02 Submissions Filed First regulator submissions filed within the engagement.
03 Engineering Escalation Infrastructure questions surfaced with clear decision criteria.	04 Repeatable Framework Legislation mapping → requirements → documents → submission.

Lessons and Next Stage

The most useful discipline came from an independent review of my policy deliverables, which caught real corrections. Rather than treating that as a setback, I built a review checkpoint into the document workflow: no deliverable moves to final status without a second set of eyes. Accuracy in compliance documentation is the product — the review step is now standard in how I work.

Next stage for the client: engineering confirmations, advancing work-in-progress documents to final, and completing the remaining regulator submissions.
